December 2021

## How Digital Forensic Data was Collected

Digital hard drive image was created.

Two image files represent the contents of the hard drive.

The industry standard Encase E01 format was used for these images.

The images, along with hashes, were provided to the analyst.

Jean User's PC was forensically imaged.

Two image files: nps-2008-jean.E01 & nps-2008-jean.E02 were produced. They are both part of the same image. The Encase splits the image into multiple 640MB files as needed.

The Encase E01 file format represents an industry standard format that is understood by a variety of forensic imaging tools.

The collected images along with hashes were provided to the analyst for discovery.

## What Tools Were Used

Autopsy 4.18 64-bit / Windows 10.

Open-source forensics toolkit built on The Sleuth Kit tools.

Modular architecture.

Encase E01 image format.

Autopsy 4.18.0 64-bit running on Windows 10 was used on the analyst's workstation.

Autopsy is an open-source forensics toolkit built on The Sleuth Kit forensic software tools package.

Autopsy's modular architecture allows the analyst to capture and understand a wide variety of data types from the forensic image (Basis Technology, 2016).

## How Digital Forensic Data was Analyzed

All default Autopsy modules were used.

Contents of various data types were discovered and analyzed.

Analysis focused on the time of event and weeks leading up to the breach.

E-mail and Office modules were used extensively.

Other module data was reviewed.

The default set of Autopsy modules were enabled to extract common data formats from a Windows XP system.

The contents of these data types were organized and presented by the Autopsy software for the analysts review.

Particular attention was paid to the time the breach was suspected and the weeks leading up to it.

The email and Office document modules were particularly relevant to this case and captured the relevant evidence as discussed in subsequent slides.

## Key Legal Considerations

Chain of custody maintained.

Analysis was limited in scope to relevant asset and data.

Forensic imaging of PC allowed by corporate policy and corporate ownership of device.

All employees shown/acknowledged policy.

The chain of custody of digital evidence was prioritized and maintained throughout the investigation.

The forensic analysis performed was limited in scope to the PC involved in the breach to protect employee data and privacy. No additional forensic images were provided for analysis.

Forensic imaging of the M57.Biz system is allowed as it is a company-owned asset and based on language in the corporate Acceptable Use Policy.

## Managing the Chain of Custody for Digital Evidence

Initial images and image hashes were taken by a 3rd party.

File hashes were calculated and the integrity of evidence was preserved.

Initial hard disk was not modified.

Evidence log was kept to track physical possession and analyst activity.

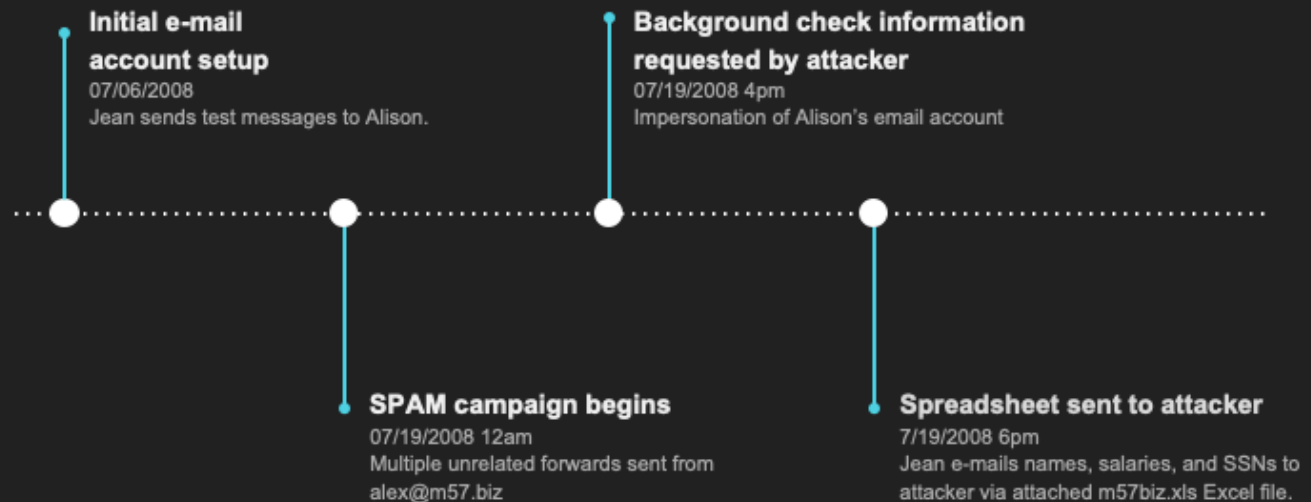

The hard drive image was collected by a 3rd party and provided to the examiner for analysis.

All work was performed on a copy of the forensic data rather than the original drive for the purposes of preserving the original if comparison is needed (Obbayi, 2019).

File hashes of the disk image as a whole and all files applicable to the investigation were taken.

An examiner log was maintained to track physical custody and forensic analyst activity concerning the M57.Biz forensic image. A form based on the NIST provided example was used (NIST, n.d.).

## Timeline of Events

07/06/2008 – Jean's e-mail account was setup and test messages from Jean to Alison were sent to ensure the system was working.

07/19/2008 00:06:31 PDT – SPAM campaign begins from alex@m57.biz address. This was potentially used to cause confusion and distract from other malicious communications.

07/19/2008 16:39:57 PDT – Initial request for background check information was sent from the 3rd party (attacker). An alternate return address was first used in this communication (presumably to capture replies).

7-19-2008 18:28:00 PDT – Jean e-mails m57biz.xls to the 3rd party. This is the message in which the data disclosure occurred.

7-19-2008 22:03:04 PDT – The 3rd party acknowledges receipt of background information spreadsheet.

7-20-16:53:19 PDT – Bob discovers his personal data posted online and informs his colleagues. Subsequent e-mails are sent trying to identify what happened.

## Summary of Findings

The 3rd party spoofed e-mail information to impersonate Alison.

The 3rd party requested personnel data based on false urgent need.

x57biz.xls spreadsheet was e-mailed to a 3rd party (attacker).

The m57biz.xls spreadsheet was created by Alison, modified by Jean, and sent by Jean.

Multiple successive failures in security controls lead to successful attack.

The 3rd party spoofed the e-mail from: address to appear as though they were from Alison and modified return addresses to capture responses.

The 3rd party requested that the employee data be provided based on the claim that venture capital investors were conducting employee background checks.

m57biz.xls Excel spreadsheet was provided via Jean's e-mail account to a third party.

The m57biz.xls Excel spreadsheet was created by Alison. It was modified by Jean before being sent to the 3rd party.

Multiple successive failures in security controls and best practices lead to a successful targeted phishing attack and subsequent disclosure of employee data.

## Recommendations

Require e-mail directory and phishing training.

Implement SPAM filter.

Enable external address highlighting and notification features.

Implement/enforce corporate policy on transmission of protected and employee data.

The e-mail setup and addresses in use were confusing for employees. Communications indicated they did not know which address to use for Alison. Corporate e-mail and phishing prevention training should be implemented and required for all employees.

Phishing prevention failed to block the phishing message set. SPAM filtration is highly recommended for the corporate e-mail system.

In-application highlighting, and warnings should be used to indicate when a message will be sent to an external recipient (Cooper, 2021).

Corporate policy should prohibit the use of e-mail to send personnel information such as was provided using the m57biz.xls spreadsheet.
